

The Rock Behind Today's Rock Music

Play a tune. Flip a switch. Send an e-mail. The technologies that surround your life are fueled by clean coal.

Abundant domestic coal fuels more than 50% of U.S. electricity, and the U.S. Department of Energy expects that it will fuel far more in the future. The top states that use the most coal enjoy electricity rates 40% below the states that rely most on other fuels. Today's technologies also mean that coal is clean. Coal used for electricity has more than tripled since 1970, while emissions have been reduced by more than one-third.

Peabody is doing its part, developing advanced technology power plants with emissions that are 80% below today's average. Tomorrow is even brighter. Peabody is part of an alliance to develop the world's first zero-emission generating plant, which would capture carbon dioxide and produce hydrogen. Peabody Energy (NYSE: BTU) is the world's largest provider of coal to fuel 21st Century energy solutions.

America has the largest coal reserves in the world... and greater use of this clean and affordable fuel can reduce our reliance on foreign oil and liquefied natural gas. That should be music to all of our ears.

Yeah... coal can do that.
